

2CS701 Compiler Construction

Practical 5	
Rollno: 19BCE236	Name: Samariya Darsh
Date: 31-09-2022	Batch: D1

Aim

To implement a calculator in YACC: Syntax Directed Translation

Code:

prac_5.y

```
%{
#include <iostream>
#include <string>
#include <map>
#include <cmath>
static std::map<std::string, int> value;
int yylex();
int yyparse();
void yyerror(const char *s) { std::cout << s << std::endl; }
%}

%union { int i; std::string *s; }
%token<i> INT
%token<s> VAR
%type<i> E
%right '='
%left '+' '-'
%left '*' '/' '%'
%right '^'
%%

SS : S SS
   | S
   ;
S : E ';' {std::cout << "Answer: " << $1 << std::endl;}
   ;
E : INT {$$ = $1;}
   | VAR {$$ = value[*$1]; delete $1;}
   | VAR '=' E {$$ = value[*$1] = $3; delete $1;}
   | E '+' E {$$ = $1 + $3;}
   | E '-' E {$$ = $1 - $3;}
   | E '*' E {$$ = $1 * $3;}
   | E '/' E {$$ = $1 / $3;}
   | E '%' E {$$ = $1 % $3;}
   | E '^' E {$$ = pow($1,$3);}
   ;
```

```
%%  
int main() { yyparse(); }
```

prac_5.l

```
%option noyywrap  
%{  
#include <cstdlib>  
#include <string>  
#include "y.tab.h"  
using namespace std;  
%}  
%%  
([_a-zA-Z](0-9)*)+ {yylval.s = new string(yytext); return VAR;} [0-9]+  
{yylval.i = atoi(yytext); return INT;} [-+*/%^=;] {return *yytext;}  
[.\n\t] ;  
%%
```

Input:

```
a=2;  
b=5;  
c=9;  
  
a+b;  
a-c;  
b*c;  
c/a;  
b^a;  
c%b;
```

Output

```
Answer: 2  
Answer: 5  
Answer: 9  
Answer: 7  
Answer: -7  
Answer: 45  
Answer: 4  
Answer: 25  
Answer: 4
```

```
E:\VIRMA\Sem 7\2CS701 - Compiler Construction\Practicals\Practical 5>
```

Conclusion

In this practical, we learnt how to perform some basic arithmetic calculations using parser and lexer.
